

## Tutorial on how to use Fotoflexer.com

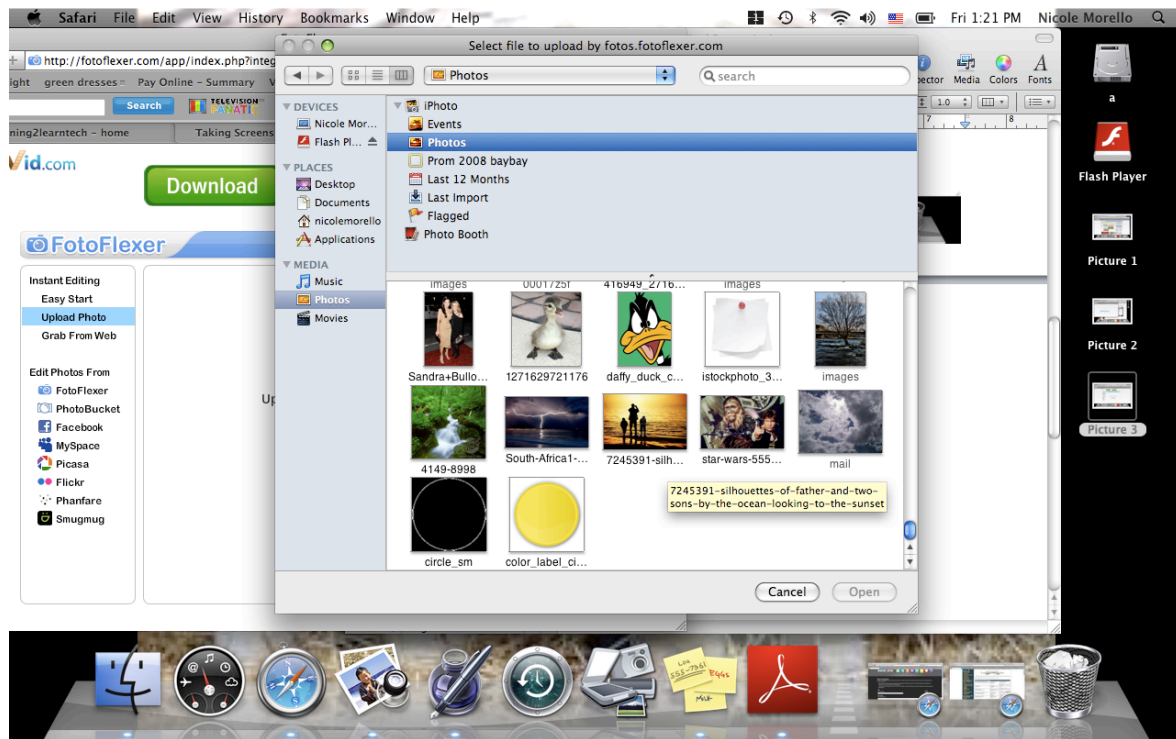

1. Go to fotoflexer.com. Click Upload photo. You will have to wait approximately one minute for it to load.

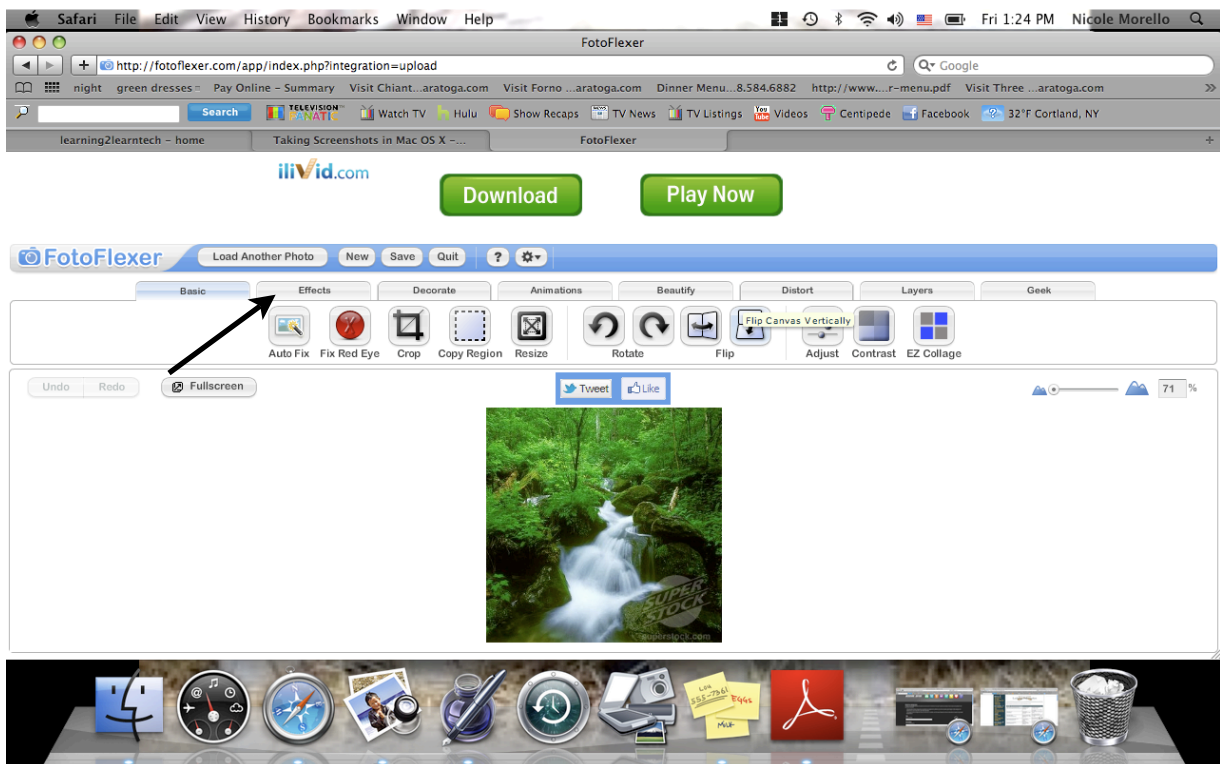

2. You will then click Upload.

3. You will then have to choose a photo that you have saved in your photo library.

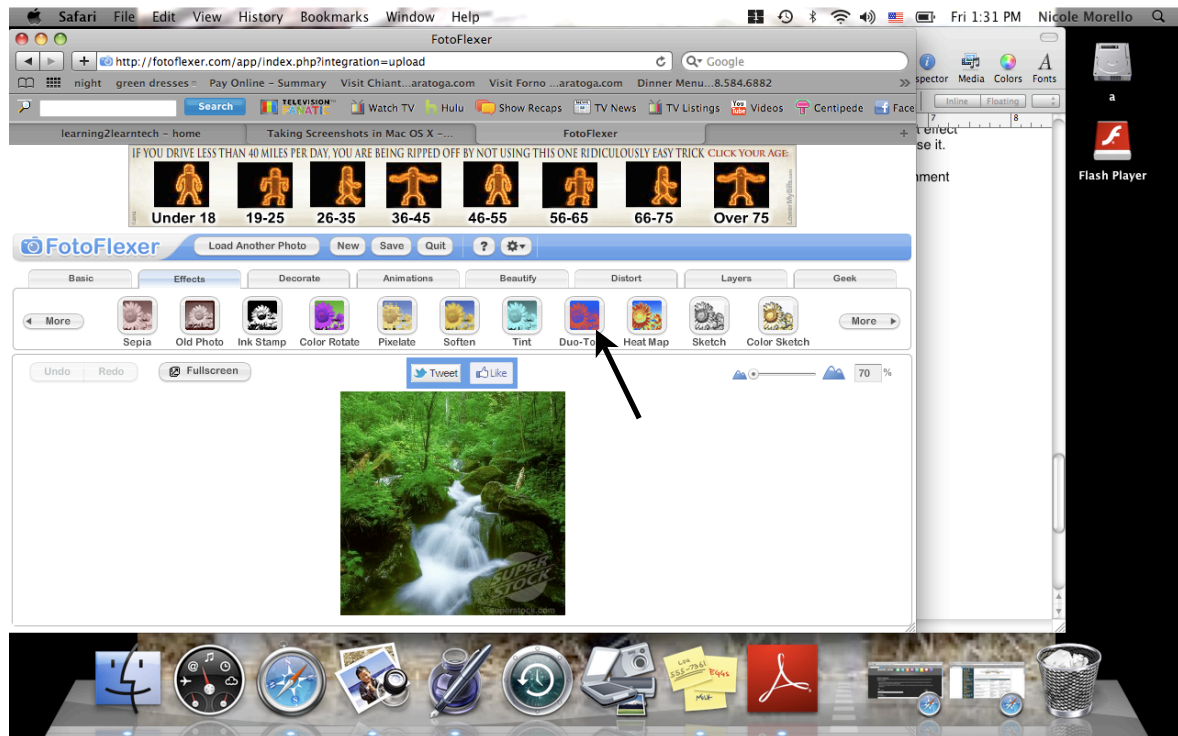

4. You will then come to the main page for editing your photo.

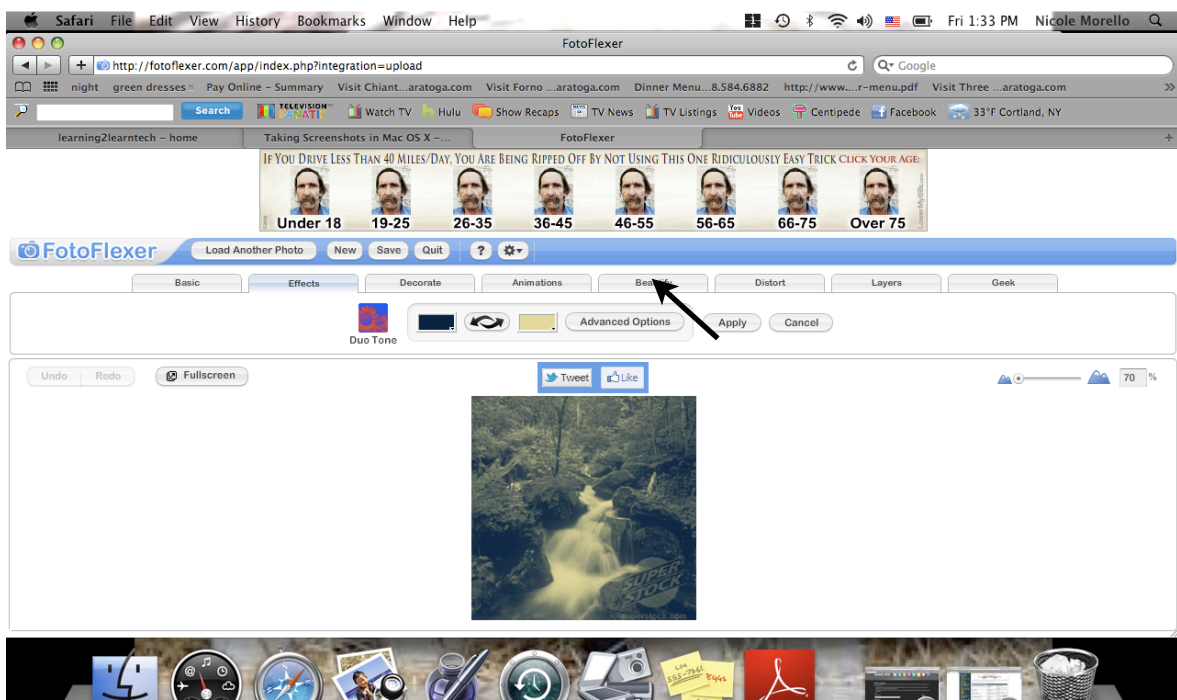

You will see that there are multiple tabs to use for different types of editing. Today, we will focus on the actual "effects tab".

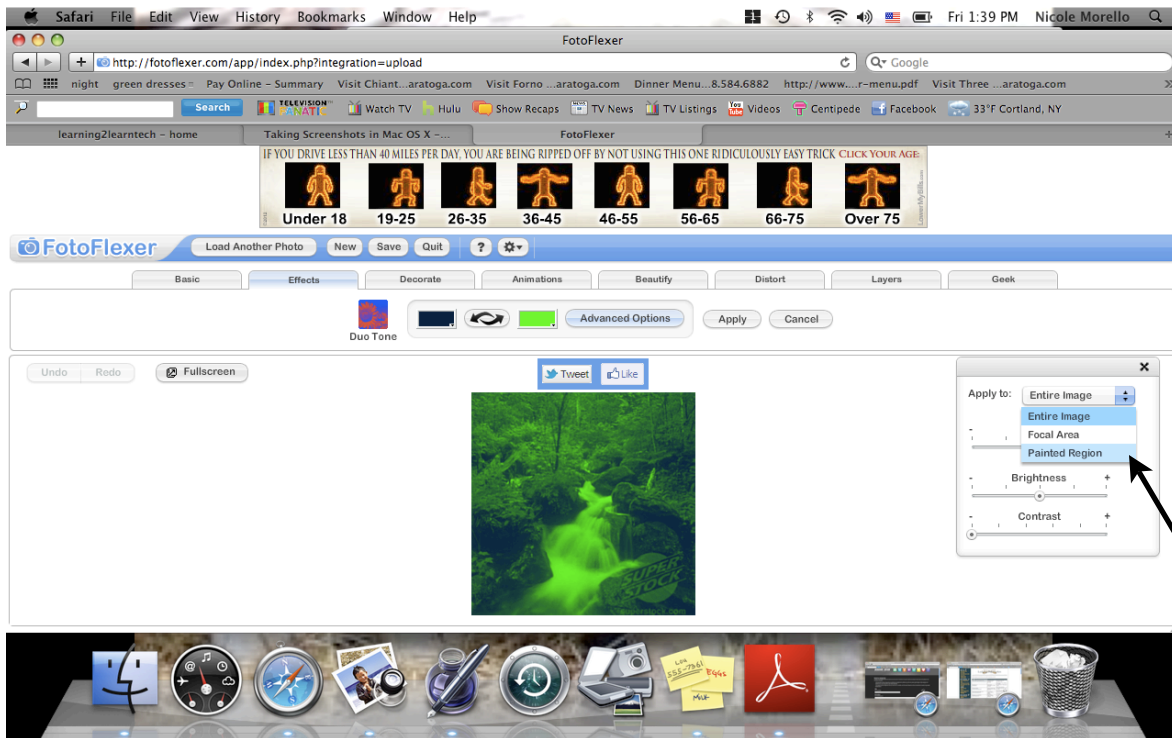

5. When you click on effects, there are many different blocks to chose from. You can hit more to the right or left to scroll through all of them. The titles of each different effect are pretty self explanatory. However, let's focus on one and how to properly use it.
6. Let's focus on the Duo Tone. This was one of the effects that I used in an assignment for DS106.

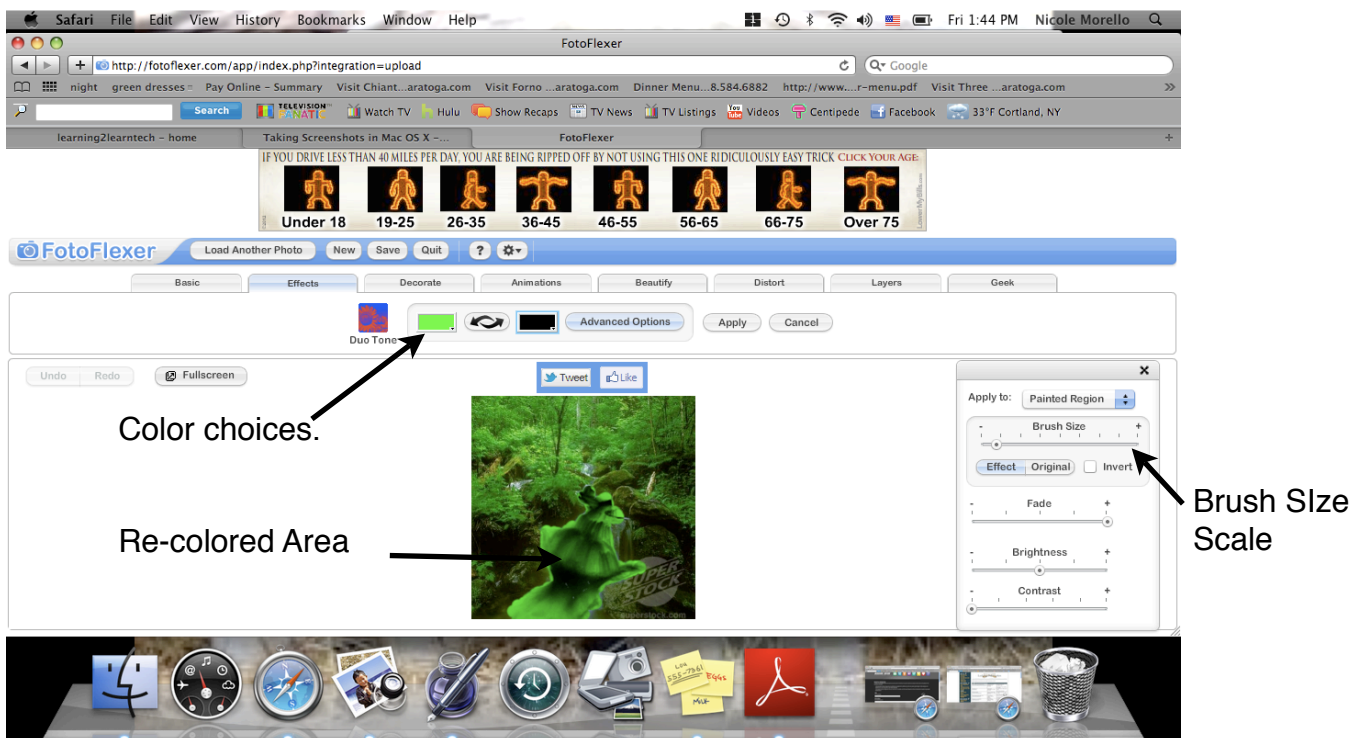

7. When you click on this option this next page will come up. It automatically creates the effect on the picture. However, if you click the “advanced options” button, you can play around with what gets colored, and how it gets colored.

8. Once you click “advanced options” the drop box to the right will appear. I usually chose “painted region” so that you get to pick with the “paint brush” exactly what is getting effected.

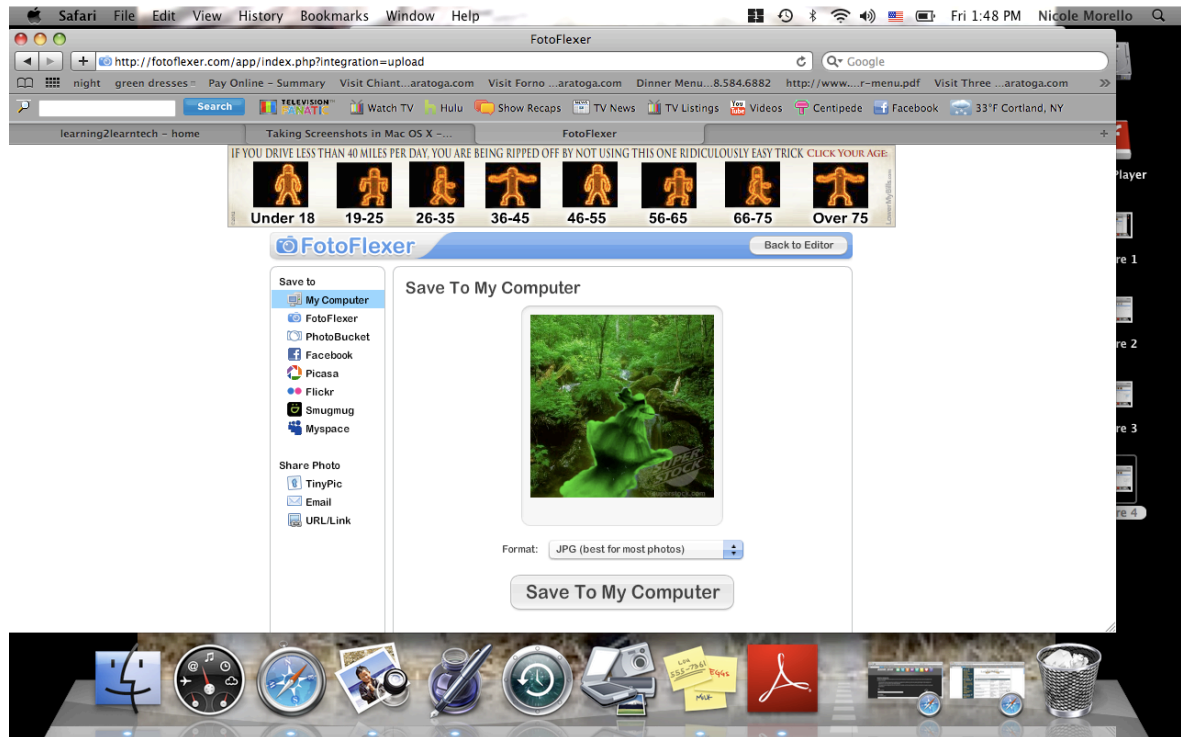

9. You then make sure that the colors are set. Chose your brush size. And start coloring in the spot you want re-colored.

10. Play around with the whole picture and how you want it to be colored! It's a lot of fun!

11. Once your done, hit save to my computer.

12.  
You are all done! :)
